DETAILED ACTION

Allowable Subject Matter

Claims 1-16; 18-21; 23-28 are allowed.

Re claim 1, while, the cited prior art of record disclose of a system for audio reproduction comprising: means for obtaining one or more audio signals that are representative of sounds occurring at a first location; means for communicating the audio signals from the first location to a second location of a person; means for determining a position of a head of the person in at least two dimensions at the second location by imaging the person; and plural means for reproducing an audio field at the second location from the audio signals, wherein sounds emitted by each means for reproducing are controlled based on the position of the head of the person, wherein the plural means for reproducing are arranged spaced apart and directed toward a center and wherein a particular one of the audio signals applied to a particular one of the means for reproducing is time delayed based on the position of the person to maintain equal arrival times of the sounds to the person as the person moves around to different locations at the second location.

However, none of the prior art of record as in combination disclosed wherein a perceived volume of the sound by the person is equal and independent of the position of the head of the person as the person moves around the second location.

Re claim 21, while, the cited prior art of record disclose of a method for audio reproduction comprising: obtaining one or more audio signals that are representative of sounds occurring at a first location; communicating the audio signals from the first location to a second location of a person; determining a position of a head of the person in at least two dimensions at the second location by imaging the person; reproducing an audio field at the second location from the audio signals, wherein sounds emitted by each of plural means for reproducing are controlled based on the position of the head of the person, wherein a particular one of the audio signals is multiplied by a factor related to the position to determine a desired signal level for the particular one of the audio signals and when the desired signal level is substantially different from a current signal level gradually adjusting the current signal level toward the desired signal level; and modifying the audio signals to achieve a time delay of the sounds emitted by the plural means for reproducing to maintain equal arrival times of the sounds to the person as the person moves around to different locations at the second location,.

However, none of the prior art of record disclose as in combination as wherein the audio signals applied to the plural means for reproducing are multiplied by a ratio of a horizontal distance between the plural means

for reproducing and the head of the person to a horizontal distance
between the plural means for reproducing and a center.

Similarly, Re claim 25 has been analyzed and allowed for same
reason as in claim 21.
